**News and
Information About
Golden Retrievers
For Those Who
Love Them**

From Our President!

Dear Rescue Family,

Golden Retriever Rescue of Central New York (GRRCCNY) was formed in 1995 as a committee of the Golden Retriever Club of Central New York. GRRCCNY was established independently in 1998, so as to pursue charitable group status with the IRS. Two of the original committee are still a part of rescue.

Our mission states “to provide re-homing services to purebred Golden Retrievers and to help the public be informed about the care and training needs of this breed.” We knew because of our on-going programs and outreach, such as our newsletter, website, Facebook, and events, informing and helping folks with their golden retrievers, we would one day be out of a job of rescuing golden retrievers. We are at that juncture in our rescue journey. It is time for our rescue to write it’s final chapter. I look at this as a good thing! We have done our job well.

Years ago, we rescued 40-50 goldens a year and placed them in forever homes, last year we rescued 8. That has been the trend for many years.

At our board meeting in February and quarterly meeting in March, it was decided that we develop and implement a plan of dissolution in 2020. This is not taken lightly nor was this the first time there was a discussion of dissolving the rescue. In 2010, Carol Allen developed a “Program Dissolution Plan” for the rescue after a board meeting earlier in the year. She saw a time when we would take fewer and fewer goldens into rescue. It was also noted that fewer and fewer volunteers were active in rescue and that the current volunteers were getting older.

Over the years we had a large group of volunteers helping with fostering, administration, events, and outreach. We are down to seven faithful members that make up our officers and board. Most of our officers and board are 55 years of age or older.

We will be rolling out the plan in the coming months, though currently it is sometimes difficult to interact with each other through technology, as face to face meetings are on hold.

One subject I would like to address now, instead of later, are your donations. We will no longer be taking donations through Paypal or by mail. We have agreed that our treasury (after expenses) be donated to the Golden Retriever Foundation’s April Fund. Our rescue has used the fund many times in the past to help with medical issues of our rescued goldens.

In conclusion, we welcome your thoughts and concerns as we move towards our journey’s end. You can write us at grrccny@lightlink.com.

If ever there was a time we needed our goldens, it is now. Hug them close and stay well.

Paws Up!

Dogbreath!

by Kathy Hughes, V.M.D.

Dan and his big handsome Golden, Buddy, were my first Monday morning appointment.

“Morning, Dan. What can I help you with today?”

“I’m real worried about Buddy,” he responded. “His breath stinks and he doesn’t want to chew on his marrow bones and antlers anymore.”

An oral exam quickly revealed the problem. Buddy had broken his tooth and had a slab fracture on his upper 4th premolar. What exactly does that mean? Grab your dog, lift his upper lip, and look at the biggest molar on the top. That’s the 4th premolar and it works with the big lower molar as the primary chewing and shearing apparatus. A slab fracture occurs when the side of the tooth shears off, exposing the pulp. It’s very painful and the tooth can easily become infected. 99.9% of these are treated with surgical extraction of the tooth, which has three large roots and is challenging to remove! Root canal procedures are sometimes possible but require a veterinary dental specialist.

My next appointment, Austin – a 5 year old bouncy Golden that the owners had no real concerns about, was scheduled for a regular checkup and preventative care.

“Oh yeah, his breath is nasty but he does eat poop! Sometimes he doesn’t want his rawhides, but we figured he was just being picky.” An oral exam revealed heavy tartar, a few loose teeth and gingivitis. Dogs are really good at hiding the fact that their mouths hurt.

Now it’s Friday afternoon and my last appointment arrives. It’s Karla and her sweet old Golden girl, Sophie. Both are particular favorites of mine. As I entered the room, I detected a foul smell and immediately knew this was not going to go well.

“Hey, Karla. What’s going on?”

“I’m so worried about Sophie,” she replied. “Her breath smells really bad, she’s drooling nasty stuff and she doesn’t want to eat.” The exam confirmed my worst fears – Sophie had a large tumor in the back of her mouth. Sadly, there were no reasonable options for treatment. I sent them home with strong pain medications so the family could say goodbye – knowing Sophie’s next visit would be her last.

Three stories, three problems, three very different outcomes. The common denominator: Oral pain and bad breath. **My point? Regular oral care at home and professional dental cleaning and evaluation are very important components of pet care.**

Now, let’s dispel some myths and misconceptions:

- “A dog’s mouth is cleaner than a human mouth.” Really???? Think about what they eat and what they lick.
- “He gets his teeth brushed every time he goes to the groomer.” Daily oral care is the gold standard to maintain good oral health. Oral care once every 6 to 8 weeks doesn’t make much sense.
- “He gets lots of dog biscuits.” Most Golden Retrievers I know don’t spend much time chewing their food or treats. Lots of biscuits are great at making your dog overweight but pretty lousy at cleaning his teeth.

Home dental care is a lifelong commitment, starting as soon as you bring your new puppy home. Start by gently lifting his lips and brushing those sharp little teeth several times a week. This shouldn’t be too challenging since you’re likely to be in his mouth many times a day to retrieve stolen

Kathy Hughes and Piper

items! You can use a dog toothbrush, a child's toothbrush, a finger brush (fits over your fingertip and has lots of nubby things on it) or even a cloth or gauze wrapped around your finger. Be sure to use special toothpaste for dogs which is meant to be swallowed and does not contain artificial sweeteners that can be toxic. Dogs adopted as adults must be trained to accept tooth brushing. Just go slowly – a little bit at a time – and use lots of treats to make it a positive experience. Remember to NOT crank the mouth open. They really hate that. You can accomplish good oral care by just lifting lips away from the teeth and gums. This will give you good access to the areas on the teeth on both the upper and lower jaws that collect the most tartar. An adult Golden Retriever has 42 teeth so there's a lot of brushing to do!

Along with routine brushing, a few other things can help keep your Golden's teeth in good shape:

- Commercial dental treats and “dental diets” can help IF the dog actually chews them.
- Oral rinses work best to prevent new tartar buildup, but won't remove existing tartar.
- Rawhides are pretty good at helping keep teeth clean, but I have several rules about them. I only recommend USA sourced and manufactured retriever rolls. These are a single piece of rawhide rolled up into a cylindrical shape and do not contain any little pieces. They should never be given in an unsupervised situation and removed from the dog once smaller than 3 to 3½ inches. Of course, you must be able to take it away from the dog. If he's reluctant to allow that, pick another type of chew! An adult Golden can generate bite force of about 250 pounds per square inch (the average human comes in at 130). Therefore, please do NOT use hard marrow bones, antlers or even “Nylabones” for aggressive chewers. These are harder than the dog's teeth and many dogs may break big, important teeth. Buddy is a good example of that.

Professional dental care is as important for dogs as it is for us. This anesthetic procedure includes evaluation of the entire mouth and all of the teeth. An ultrasonic scaler is used to clean the teeth including below the gum line then they are polished using a paste similar to what your dental hygienist uses. X-rays are taken of all teeth to look for hidden disease. This whole process takes about an hour to. If extractions or other oral surgery are needed, they may be done during that initial visit or scheduled another time.

So – please look in your Golden's mouth often, brush his teeth and have them cleaned when your vet recommends. Your best friend will thank you and his breath will stay sweet and fresh!

Hug your dog!!!

Diary of an Adopted Golden

by Lexi Chagoll

Part 12 – We are FAM – IL – LEEY !!

Curiously, I cocked my head at the strange gesticulations and alien noises emanating from my Dad. He stood in the center of the room: twisting – squatting – bending – extending and recoiling his arms.

“Ooff. Arggh,” he grunted while lowering objects that looked a lot like my obedience training dumbbells, just a lot bigger and obviously heavier. I glanced to Golden brother Rook, who blinked back as to say, “Whatever. We’ve always known him to be kinda weird.” Recently I heard Dad tell Mom he couldn’t work out anymore at some place belonging to a guy named Jim. “The governor said Jim’s gotta close now, so I’m going to have to exercise here at home.”

Lexi

After a short break, Dad then extended a mat (did he steal that from my crate?) and lay horizontally on the floor. He resumed with a new series of strange moves. After a number of extensions and retractions of legs and arms he began huffing, puffing and grunting even louder than before. Looked to me and Rook like Dad was suddenly in trouble and needing immediate assistance. We leapt from the couch and rushed to either side of his head, quickly administering first aid.

“SLUURRRP.” We each painted a cheek, and stood back to assess the results.

“LEXI. ROOK. Cut it out, will ya? Can’t you see I’m busy here? Go back to the couch, please.”

Some gratitude. Apparently this is how Dad sometimes likes to enjoy himself: making loud noises and looking like he’s about to have The Big One. Humans certainly have their idiosyncrasies!

Bernese Mountain Dog brother, Dante, has his own way for assisting Dad’s workouts. Waiting ‘til Dad has both hands occupied with heavy weights, Dante likes to sneak from the rear – delivering a quick muzzle punch squarely to center of the buttocks. Kinda fun to hear the noises Dad makes when THAT happens!

Somethin’s definitely afoot these days, though. Mom’s been spending a lot more time at home, too. But we dogs – me, Rook and Dante – are not complaining. Seems to us Saturday and Sunday now come like three times a week! Weather permitting, the folks are taking us for extended walks and play time more frequently.

I do have a beef about Mom, though. Used to be every morning before she left for work and when she returned in the evening, being the gracious daughter-dog, I ceded to her my reserved spot on the couch. Now, she seems to think she’s entitled to it all day! How cheeky, don’t ya think? She sits there, for hours, with her laptop, “working from home,” she says. I like to remind her THAT particular real estate is but on short term daytime loan, by shmooshing smack-up close to her side and demonstrating “social distancing” – Golden Retriever style!!

Another disturbing note: Lately it seems Mom and Dad get a bit agitated when watching the evening news, and seriously need to be distracted from that stuff. To all you Goldens out there (other pooches, too): Is this happening at your place also? Some distractions that have worked well at my house: Go stand in front of the TV with a tennis ball or your favorite Woobie until somebody plays fetch. Climb in a needy lap and head-butt the hand until it begins petting you. Go to the window or door and start whining for some outside exercise. My sense of things is, for whatever reason unknown to us canines, our humans need us now more than ever. So, we gotta step up. After all, as they’re saying all the time on television, “We’re all in this (whatever THIS is) together.”

While I think of it, a brief commercial message: The wonderful folks who print my column and the rest of The Barquer are closed right now. Dad says that's why my column had to be shorter this time. By some magic – and that's all I'm gonna say – this edition nevertheless got printed. PLEASE remember this very nice gesture, and when Gnomon Copy in Ithaca is once again operating, please stop in and say “thanks” by rewarding them with as much business as you can.

We dogs want you to know we're thankful for our families. When either cuddling or out walking and playing with Mom and Dad, I occasionally like to hum a few bars of my slightly modified version of that old Sister Sledge favorite:

We are FAM – IL – LEEY
I got all my Humans with Meey
Get up everybody and Sing!

Until next time...

Lexi

Rue Chagoll's Postscript:

Lexi was adopted in October 2014 and is formally recognized under AKC's Purebred Alternative Listing (PAL) program as Witrin's Lexicon for the Ages BN CD PCD RI CGC TT CCA. All those letters mean she's earned her Canine Good Citizen recognition and several obedience and rally performance titles. She's also been certified in temperament testing and earned the Golden Retriever Club of America's Certificate of Conformation Assessment. Lisa Mitchell and I are grateful to GRRCNY for bestowing this beautiful Golden gift who's brought so much joy to our lives.

See what I mean? Here Mom sits in MY SPOT all day long and won't even schmooze with me. Can you detect a hint of annoyance in my expression?

RAINBOW BRIDGE CROSSINGS

We adopted our wonderful **Lela** from GRRRCNY almost 3 years ago when she was 10+ years old. It has been a great adventure with a most loving, intelligent, faithful dog who was almost always at my side. Sadly, Lela had to be euthanized last evening, suffering from hemangiosarcoma, cancer of the spleen. Toni and I miss her terribly, but we will always be grateful to Sallie and GRRRCNY for trusting us with this beautiful dog. Bob and Toni Brinster

Lela

The Rainbow Bridge Memorial pages are now on the website at: <http://www.grrrcny.org/memorial.html>. Starting with 2017 Summer Barquer, the memorial pages may only be viewed on the website.

03/31/20: GRRCNY COVID-19 Response: Effective immediately we are not accepting new foster or adoption applications until at least April 30. This will be re-visited towards the end of April to determine if it is safe for our volunteers to resume home visits.

It is important to note the CDC (Centers for Disease Control) has stated there is NO evidence at this time that pets can spread COVID-19

IF YOU MOVE or head down south for the winter..... please let us know if your postal address changes. The Post Office makes money with each returned piece of mail (and we have better uses for your donations).

Write to GRRCNY, PO Box 735, Jamesville, NY 13078 or Janet Gray, grrcny@lightlink.com.

We are also interested in having your current email address. Janet would be happy to receive that, too.

Summer Health Concerns

Compiled from articles by Janice Brown, Dr. Tracy Powell DVM, and Carol Allen

Summer is here and along with the warm weather, we, as pet owners, need to start thinking about keeping our goldens safe from hazards that come along with the summer.

FLEAS are easier to prevent than to eliminate once present. Please consider what you will do to prevent them. Options range from a monthly topical treatment to garlic, but please consider what your prevention strategy will be. Fleas are at best annoying and at worst extremely uncomfortable to dogs allergic to flea bites; they transmit tapeworm, and don't limit their bites to animals. Fleas shouldn't be taken lightly.

HEARTWORM, carried by the mosquito from an infected dog to a healthy one, will kill if untreated. Treatment, once heartworm is present, is costly to you and dangerous to your dog. Prevention works and must be agreed to by every adopter. Your veterinarian and you can decide about year-around use or use during "mosquito season" only. We still hear people say that there "is no heartworm in this area." This is absolutely false. Any veterinarian will tell you of the number of heartworm cases his/her office treats each year. GRRCCNY pays for treatment for several dogs each year prior to adoption.

RABIES is the disease that people are most conscious of and local laws require rabies vaccines. Most veterinarians monitor the vaccine schedule carefully for you, but we suggest you simply check your records for current dates. Rabies is transmitted by bats, rodents, raccoons, foxes, other domestic and wild animals, and can be fatal to humans as well as your pets.

LYME DISEASE is something that you should also discuss with your veterinarian, particularly if you plan to travel with your dog. There are preventive vaccines available. Certain areas of the state and country have a high incidence of Lyme Disease, which is transmitted by a tick that deer carry.

TICKS can also cause other diseases that can result in serious illness or death, including tick paralysis. This condition is caused by several tick species and shows itself as loss of motor skills. The paralysis affects the muscle-nerve junction throughout the dog's body. This condition has been found worldwide but may show differences in paralytic responses. If the tick is found and removed early, the dog usually recovers completely.

Tick removal is accomplished with a set of tweezers by carefully grasping the exposed section of its body at the pet's skin. The tick should be gently pulled until the tick removes its mouthparts and lets go of the golden. A small amount of flesh should be apparent on the mouthpieces of the tick if it has been removed correctly. If you squeeze the tick while removing there is a chance that it may inject the golden with infectious material. **BE CAUTIOUS.** After removal the bite should be cleaned with a disinfectant. Once the tick is removed, put it in a small container labeled with the time removed, date, your name and contact information. Then give it to the vet for identification and analysis. Old wives tales say that you can smother ticks with petroleum jelly or nail polish, or burn the tick off, but in actuality these methods don't work. Tick control should involve your veterinarian because they have an understanding of how medication will affect your pet. When the dog's tick problem is under control, it's time to think about removing ticks from the dog's environment. Ticks can infect the house and yard, which can be fogged. Be sure to use a fogger that says it can be

safely used in the yard, house, kennel, etc. Foggers work the best because they reach areas that aren't easily accessible. Yards should be sprayed every two to three weeks.

Another concern for pet owners during the summer is **HEAT EXHAUSTION** and **HEAT STROKE**. Please be sure not to leave your dog in the car when it's hot outside. Even with the windows open, the temperature in your car can soar over 100 degrees in a matter of minutes. Dogs don't sweat all over their body, only in a few locations, especially the paws. So, they cannot regulate their body temperature as fast and easily as we can. Besides panting, there are other ways to tell that your dog is hot. Watch them walk on a smooth surface and see if doggy paw prints are left on the floor where they walked. That means that they are sweating. Decreased activity and appetite are other things to watch for. It's important to not exercise your dog too much, leave them in direct sunlight, or deprive them of water during the warm months. **ALWAYS** have water available for your dog!

Heat exhaustion and heat stroke occur more often during the warm weather. Heat exhaustion results from water and salt depletion and the dog's temperature is normal to mildly increased. Heat stroke is much worse and there is an increased body temperature. Heat stroke also causes normal body physiology to become abnormal--the pet then cannot control their body temperature. Body temperatures over 108 degrees can lead to cell damage in the body (normal dog temperature is 100.5 – 102.5 degrees). The signs of heat exhaustion include weakness, increased heart rate, increased breathing rate (panting), nausea, vomiting, and muscle cramps. To treat heat exhaustion, the dog should be allowed to rest in a cool place with water available.

Heat exhaustion can quickly lead to heat stroke, and with heat stroke, increased heart and breathing rates can lead to collapse. Once again, the difference between exhaustion and stroke is that heat stroke has an increased temperature and the signs are more severe than exhaustion (severe panting, continuous vomiting, etc.). You can take your pet's temperature at home with a rectal thermometer to determine if heat stroke is present. If you see signs of heat stroke (increased temperature, collapse, etc.) or if the signs of heat exhaustion are not resolving with rest in a cool place, you should bring your pet to the vet immediately. Treatment depends on how high the dog's temperature is. If the body temperature is less than 104 degrees, allowing the dog to rest in a cool place with available water should bring their temperature back down. Their temperature should be monitored to make sure it becomes normal and stays normal. If the dog's temperature is over 104 degrees, they need intravenous fluids, oxygen, a cool bath, fans blowing cool air on them, and their temperature needs to be rigorously monitored.

Another favorite summertime activity is **GARDENING**. It's important to protect your pet not only from toxic plants, but also from the chemicals you spray on your lawn and garden. As you know, dogs roll around in the grass and then lick themselves and often eat grass and plants. Also, be very careful if you use rodent traps with bait in them, or snail/slug bait to control the pest population. It can be toxic to your pets if they get into it. Don't use insect, slug or rat bait that contains strychnine, metaldehyde or warfarin. Don't use sprays for your garden and lawn that contain organophosphates or carbamate. Lawn and garden products that contain these substances will have one of the following names on their ingredient label: chlorpyrifos, malathion, diazinon, fenthion, or ronnel. Some poisonous plants you should watch out for include: English Ivy, Daffodil, Aloe, Japanese Yew, Easter Lily, Tiger Lily, Poinsettia, Dragon Tree, Castor Bean, and the pits and seeds of peaches, cherries, apricots, and apples.
